

ABSTRACT OF THE INVENTION

The present invention is to provide a mechanism for quickly removing an electronic device from a PC having a smaller case, which comprises a slot in the PC having one or more recesses at either side, enabling a tray installed

- 5 with the electronic device to be inserted therein through a front opening of the slot and enabling one or more snapping members on either side of the tray to be adapted to snap into one or more recesses on the slot. In an operation of removing the electronic device from the PC, a user may pull a first clinging member of a pivotal gate at the front opening to open a gate upward, and then
- 10 hold a handle of the tray to quickly pull the tray toward the front opening of the slot.
